There is no doubt that renewable energy technology is set up to grow in all its forms by at least 20% per annum. Every country is putting millions to harness clean and sustainable energy. Investment is set to grow and industries are being set up in many regions of the world. China is one of the countries which is progressing on a very large scale despite the fact it also still building coal power stations at the rate of one every few days. US and Europe are leading the way in Wind Energy utilization and Photovoltaic Technology, while progress in Biofuel and Waste to Energy have also been achieved everywhere.

Examples of 70 MW PV in Italy, 300 MW off shore wind farm in the UK and having most of the European Countries intruding the feed – in tariff will accelerate the use of renewable energy. In the Gulf States: Saudi Arabia investing US\$ 250 billion in renewable energy, Abu Dhabi set up MASDAR with US\$ 18 billion toward a solar city, Kuwait just announced the setting of US\$ 2 billion centre of renewable energy and Qatar already allocated US\$ 1 billion towards renewable energy. Malaysia is entering the PV manufacturing stage and speeding up the use of renewable energy in giving incentives to various industries.

My prediction in 2020, Renewable Energy will be number one source of energy in the world.
